1. THE SGRQ

The SGRQ-C was developed from the SGRQ which was designed to measure health impairment in patients with asthma and COPD. The SGRQ is also valid for use in bronchiectasis and post tuberculosis and has been used successfully in patients with kyphoscoliosis, sarcoidosis. It is not suitable for cystic fibrosis. It is in two parts. Part I produces the Symptoms score, and Part 2 the Activity and Impacts scores. A Total score is also produced.

2. SGRQ-C: DIFFERENCES FROM THE SGRQ

The SGRQ-C is a shorter version derived from the original version following detailed analysis of data from large studies in COPD. The intention was to remove the items with the weakest measurement properties in the original instrument, but at the same time ensure that its scores were directly comparable with the original SGRQ. A full description of this process and validation studies has been published in Chest (Meguro et al. Chest 2006;132: 456-463). The accompanying on-line supplement gives additional details concerning its development and the differences from the original. ([http://chestjournal.org/cgi/content/full/chest.06-0702/DC1](http://chestjournal.org/cgi/content/full/chest.06-0702/DC1)).

The SGRQ-C has been developed using COPD data only, so is valid for this disease. The validity for its use in other conditions has yet to be established, but it is unlikely to perform very differently from the SGRQ.

The principal differences are:

1. Smaller number of items (40 compared with the original 50).
2. In a small number of items there is a reduction in the number of response categories.
3. Change in the wording of Part 1. No specific recall period is used except for one item.

3. STRUCTURE OF SGRQ

**Part 1 (Questions 1-7)** addresses the frequency of respiratory symptoms. It is not designed to be a precise epidemiological tool, but to assess the patient’s perception of their recent respiratory problems.

**Part 2 (Questions 8-14)** addresses the patient’s current state (i.e. how they are these days). The Activity score measures disturbances to daily physical activity. The Impacts score covers a range of disturbances of psycho-social function. Validation studies for the original SGRQ showed that this component relates in part to respiratory symptoms, but it also correlates quite strongly with exercise performance (6-minute walking test), breathlessness in daily life (MRC breathlessness score) and disturbances of mood (anxiety and depression). The Impacts score is, therefore, the broadest component of the questionnaires, covering the whole range of disturbances that respiratory patients experience in their lives.

*Note: the general scale on the front page is not part of the SGRQ or SGRQ-C, but some investigators find it useful as an additional global measure.*
4. ADMINISTRATION

The questionnaire should be completed in a quiet area, free from distraction and the patient should ideally be sitting at a desk or table. Explain to the patient why they are completing it, and how important it is for clinicians and researchers to understand how their illness affects them and their daily life. Ask him or her to complete the questionnaire as honestly as they can and stress that there are no right or wrong answers, simply the answer that they feel best applies to them. Explain that they must answer every question and that someone will be close at hand to answer any queries about how to complete the questionnaire.

It is designed for supervised self-administration. This means that the patients should complete the questionnaire themselves, but someone should be available to give advice if required. It is designed to elicit the patient’s opinion of his/her health, not someone else’s opinion of it, so family, friends or members of staff should not influence the patient’s responses. If the spouse or partner has accompanied the patient they should be asked to wait in a separate area. Similarly, do not allow patients to take the SGRQ-C home to be completed since you cannot be sure that it will be completed without the help of family or friends. A recent study of the use of surrogates to complete the questionnaire has shown small but significant differences in scores obtained from the patients themselves (Santiveri et al Respiratory Medicine (2007) 101, 439–445)

Once the patient has finished, it is very important that you check the questionnaire to make sure a response has been given to every question. If they have missed an item return it to the patient for completion, before they leave.

Telephone administration of the SGRQ has been validated (Anie et al J Clin Epidemiol 1996;49:653-6.), as has computer based presentation (Meguro and Jones, unpublished), but postal administration has not.

Responding to a patient’s queries regarding completion of the questionnaire

If a patient asks for help with a question, do not provide an answer for them. The questionnaire is designed to get an understanding of how the patient views his or her illness. It is appropriate to clarify a question but not to provide an answer. Questions may be read aloud if patients have difficulty with reading, but the responses must be theirs alone. If a patient gives an answer you disagree with it is not appropriate to challenge their response or to query it. It is their view of their condition we are interested in – no matter how strange the response!

The following are notes that may help you explain to patients what is required

1. In Part 1 of the questionnaire, emphasise to patients that you are interested in how much chest trouble they have recently. The exact period is not important. We are looking for an impression or perception of health.

2. An attack of chest trouble (Part 1, Question 5) is any episode of worse symptoms that constitutes an attack in the patient’s own judgement. Not just severe attacks as judged by medical staff.

3. COPD can vary day-to-day. Part 2 is concerned with the patient’s current state (i.e. on average over ‘these days’), not necessarily just today.

4. For Part 1 Question 6, emphasise that you are interested in the number of good days that they have had.
5. In Part 2, Questions 8 and 14 require a single response, but Questions 9 to 13 require a response to every question. It may be worth emphasising this to the patient.

6. Many patients do not engage in physical activity. It is important to determine whether this is because they do not wish to (in which case the answer would be ‘False’) or cannot engage in these activities because of their chest trouble (in which case the answer would be ‘True’).

7. Responses to Questions 12 and 13 concern limitations due to breathing difficulties and not any other problems. If the patient does not engage in an activity for another reason, they should tick ‘False’.
5. ITEM WEIGHTS

Each questionnaire response has a unique empirically derived ‘weight’ (Quirk et al Clin Sci 1990;79:17-21; Quirk et al Eur Respir J 1991;4:167-71). The lowest possible weight is zero and the highest is 100. Note that, in cases where the two response options to an item in the original SGRQ were combined in the SGRQ-C, the weight for the new response option was calculated from the mean of the two that were combined.

(Note: the wording is abbreviated from that used in the questionnaire.)

PART 1

Question 1: I cough:
Most days 80.6
Several days 46.3
With chest infections 28.1
Not at all 0.0

Question 2: I bring up phlegm (sputum):
Most days 76.8
Several days 47.0
With chest infections 30.2
Not at all 0.0

Question 3: I have shortness of breath:
Most days 87.2
Several days 50.3
Not at all 0.0

Question 4: I have attacks of wheezing:
Most days 86.2
Several days 71.0
A few days 45.6
With chest infection 36.4
Not at all 0.0

Question 5: How many attacks of chest trouble have you had
3 or more 80.1
1 or 2 attacks 52.3
None 0.0

Question 6: How often do you have good days (with little chest trouble)?
None 93.3
A few 76.6
Most are good 38.5
Every day 0.0

Question 7: If you have a wheeze, is it worse in the morning?
No 0.0
Yes 62.0
PART 2

Question 8: How would you describe your chest condition?
The most important problem I have 82.9
Causes me a few problems 34.6
Causes no problem 0.0

Question 9: Questions about what activities usually make you feel breathless.
Getting washed or dressed 82.8
Walking around the home 80.2
Walking outside on the level 81.4
Walking up a flight of stairs 76.1
Walking up hills 75.1

Question 10: More questions about your cough and breathlessness.
My cough hurts 81.1
My cough makes me tired 79.1
I get breathless when I talk 84.5
I get breathless when I bend over 76.8
My cough or breathing disturbs my sleep 87.9
I get exhausted easily 84.0

Question 11: Questions about other effects your chest trouble may have on you.
My cough or breathing is embarrassing in public 74.1
My chest trouble is a nuisance to my family, friends or neighbours 79.1
I get afraid or panic when I cannot get my breath 87.7
I feel that I am not in control of my chest problem 90.1
I have become frail or an invalid because of my chest 89.9
Exercise is not safe for me 75.7
Everything seems too much of an effort 84.5

Question 12: Questions about how activities may be affected by your breathing.
I take a long time to get washed or dressed 74.2
I cannot take a bath or shower, or I take a long time 81.0
I walk more slowly than other people, or I stop for rests 71.7
Jobs such as housework take a long time, or I have to stop for rests 70.6
If I walk up one flight of stairs, I have to go slowly or stop 71.6
If I hurry or walk fast, I have to stop or slow down 72.3
My breathing makes it difficult to do things such as walk up hills, carry things up stairs, light gardening such as weeding, dance, play bowls or play golf 74.5
My breathing makes it difficult to do things such as carry heavy loads, dig the garden or shovel snow, jog or walk at 5 miles per hour, play tennis or swim 71.4
Question 13: We would like to know how your chest trouble usually affects your daily life.
I cannot play sports or games 64.8
I cannot go out for entertainment or recreation 79.8
I cannot go out of the house to do the shopping 81.0
I cannot do housework 79.1
I cannot move far from my bed or chair 94.0

Question 14: Tick the statement which you think best describes how your chest affects you.
It does not stop me doing anything I would like to do 0.0
It stops me doing one or two things I would like to do 42.0
It stops me doing most of the things I would like to do 84.2
It stops me doing everything I would like to do 96.7
6. SCORING ALGORITHM

A Total and three component scores are calculated: Symptoms; Activity; Impacts. Each component of the questionnaire is scored separately:

6.1 Sum the weights for all items with a positive response

SYMPTOMS COMPONENT

This consists of all the questions in Part 1. The weights for Questions 1-7 are summed. A single response is required to each item. If multiple responses are given to an item, the weights for the multiple positive responses should be averaged then added to the sum. This is a better approach than losing the data set and this technique was for calculating scores used in the original validation studies for patients who gave multiple responses. (Clearly a better approach is to prevent such multiple responses occurring).

ACTIVITY COMPONENT

This is calculated from the summed weights for the positive responses to items Questions 9 and 12 in Part 2 of the questionnaire.

IMPACTS COMPONENT

This is calculated from Questions 8, 10, 11, 13, 14 in Part 2 of the questionnaire. The weights for all positive responses to items in Questions 10, 11, 13 are summed together with the responses to the single item that should have been checked (ticked) in Questions 8 and 14. In the case of multiple responses to either of these items, the average weight for the item should be calculated.

TOTAL SCORE

The Total score is calculated by summing the weights to all the positive responses in each component.

6.2 Calculate the score

The score for each component is calculated separately by dividing the summed weights by the maximum possible weight for that component and expressing the result as a percentage:

\[
\text{Score} = 100 \times \frac{\text{Summed weights from all positive items in that component}}{\text{Sum of weights for all items in that component}}
\]

The Total score is calculated in similar way:

\[
\text{Score} = 100 \times \frac{\text{Summed weights from all positive items in the questionnaire}}{\text{Sum of weights for all items in the questionnaire}}
\]

Sum of maximum possible weights for each component and Total:

<table>
<thead>
<tr>
<th>Component</th>
<th>Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Symptoms</td>
<td>566.2</td>
</tr>
<tr>
<td>Activity</td>
<td>982.9</td>
</tr>
<tr>
<td>Impacts</td>
<td>1652.8</td>
</tr>
<tr>
<td>Total (sum of maximum for all three components)</td>
<td>3201.9</td>
</tr>
</tbody>
</table>
(Note; these are the maximum possible weights that could be obtained for the worst possible state of the patient).

6.3 Handling missing items

It is better not to miss items and any missing items are the fault of the investigator, not the patient. We have examined the effect of missing items and recommend the following methods:

Part 1

Missed items are treated as if the answer was in the negative. A maximum of one missed item is permitted for this section.

Part 2

The following approach may be used. Items in Questions 9, 10, 11, 12, 13 all require a response of either ‘True’ or ‘False’. If neither box is ticked, the item should be coded as ‘missing’. The weight for that item should then be removed from the total possible for that component (and the total score). Based on an analysis of the effect of missing data on calculated scores in the original SGRQ, this method will be reliable for handling up to 3 missed items for the Activity component (items in Questions 9 and 12) and up to 5 items for the Impacts component (items in Questions 8, 10, 11, 13, 14).

6.4 Converting SGRQ-C scores to be comparable to SGRQ scores

Scores for SGRQ-C, calculated as described above, need a small arithmetic adjustment to make them directly comparable to those obtained with the SGRQ.

The adjustment is:

**Symptoms:** SGRQ score = (SGRQ-C x 0.99) + 0.94 units

**Activity:** SGRQ score = (SGRQ-C x 0.87) +7.01 units

**Impacts:** SGRQ score = (SGRQ-C x 0.88) +2.18 units

**Total:** SGRQ score = (SGRQ-C x 0.90) + 3.10 units

7. EXCEL-BASED SCORING SYSTEM

This is not yet available

8. SGRQ SCORES IN HEALTHY SUBJECTS

Means (95% confidence intervals) for SGRQ scores in normal subjects with no history of respiratory disease

<table>
<thead>
<tr>

<th>Age - years</th>
<th>FEV1 as % predicted</th>
<th>Symptoms Score</th>
<th>Activity Score</th>
<th>Impacts Score</th>
<th>Total Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>74</td>
<td>46 range 17-80</td>
<td>95 (91-99)</td>
<td>12 (9-15)</td>
<td>9 (7-12)</td>
<td>2 (1-3)</td>
<td>6 (5-7)</td>
</tr>
</tbody>
</table>
A full range of normative values for a general population studied in Spain can be found in Ferrer et al Eur Respir J 2002;19:405-413.

9. CLINICALLY SIGNIFICANT DIFFERENCE IN SGRQ SCORE

The threshold for a clinically significant difference between groups of patients and for changes within groups of patients is four units. Note this is an indicative value (the threshold is not 4.0). As with all measurements there is biological variation, sampling error and measurement error. Four units is an average value obtained in different groups of patients. Estimation of clinical thresholds, their use and implications are discussed in much greater detail in Jones P.W. Eur Respir J 2002;19:398-404 and Jones P.W. Journal of COPD 2005;2:75-79.

Note: A responder analysis using the 4 unit threshold may be suitable in some analyses. Such estimates, including the Number Needed to Treat (NNT), appear to be relatively insensitive to small differences in the value used for the threshold for clinical significance. (Jones P.W. Eur Respir J 2002;19:398-404 and Norman et al Med Care 2001;39:1039-47).
SGRQ-C translations have been produced as a result of collaboration between St George’s University of London and the following agencies: (1) MAPI Research Institute *(www.mapi-institute.com)* and (2) Oxford Outcomes ◊ *(www.oxfordoutcomes.com)*
